Please do not worry if this full aperture was filled
up with the first several tiny pinholes. They are
unavoidable in the present state of the art of
evaporating thin metallic films on glass.

In order to minimize this effect, we pay the
Evaporated Metal Films Co., of Elmsford, N. Y.,
who are pioneers in this field, to divide the coating
process into three parts. Three separate coats of
chromium are deposited in three pump-downs of
the high vacuum process. Between coats the surface
is vigorously scrubbed. And in no time at all the
tiny pinholes appear, as you may have seen. They
look worse because they look much larger than
they really are when a strong light is behind them.
The fraction of light admitted is so astronomically
small as to be quite negligible.

The pinholes will in no way interfere with the use
of the filter as bright absorber.
