

Heatmap showing the presence of 100 bird species across 100 grid cells. The legend indicates three categories: 'Species with no presence' (white), 'Species with presence' (green), and 'Species with presence and abundance' (red). The heatmap shows a high concentration of species in the central and right-hand cells, with some species having high abundance (red) in specific cells.

After Nikon F3 with its dedicated MD-4,
Nikon designed all their subsequent professional
F-series models with a built-in motor drive.
Sad to say, the arrival of AF era also signals
the diminishing of compact camera design where
we can make good use of the modular design to
setup our camera to various specific assignments.
Anyway, this has been the course for SLR
development for the last 15 years but no one
denies a fact:

Those days, Nikon made superb Motor Drives.
